

Technical Data (v. 10-15) KOKOWALL® Noise Barrier

Kokowall Noisebarrier 2,5m height in Ommen

A) General Information Kokowall Noise Barrier

Noise barrier at Enschede - length: 450 metres - height: 4,5 metres

A Kokowall noise barrier radiates warmth and befits any landscape: these are its most typical features. Kokowall is a noise barrier that can be covered with plants; its exterior has been treated with natural and durable coconut fibres. Besides a substantial sound absorption ability, coconut fibres represent the ideal point of attachment for climbers. Within a few years' time, a Kokowall noise barrier will be fully grown over.

The Kokowall noise barrier has been constructed modularly which guarantees a quick assembly process. Prefab panels placed within a steel construction of HE-A columns allow for climbers to be planted on both sides of the barrier. The Kokowall noise barrier's simple construction turns each job into a quick assembly project as well as an economical one.

Kokowall Noisebarrier in Enschede, l=200m 5m height.

A well thought out construction: A sound insulating plate locked between two rows of sound absorbing coconut fibre sticks makes for a kind of "sandwich construction" that guarantees an insulation R_w of 30dB. The regular Kokowall barriers together with a sound insulating plate fall into sound insulation category B3, EN 1793 standard. A heavier sound insulating plate can be applied if a very high noise reduction is required. The Kokowall barrier is also available as a visual barrier without the noise insulating properties. This barrier comes equipped with one row of tubes without an insulating plate and serves as a visual partition.

The Kokowall barrier is a lightweight noise barrier. This barrier absorbs sound and insulates very well despite its limited panel mass of 25 kg/m².

The panels were tested at the TNO institute at Delft and can be supplied in several sizes. The Standard panel has an, Absorption (A) category for noise barriers. $D_{la} = 7$ dB, (cat. A2, EN norm 1793-1 for noisebarriers). The High Absorptive panel has an extra sound absorption layer of mineral wool applied in the panel. (>11dB cat. A4. EN-1793-1)

Kokowall Noisebarrier in Vianen, l=200m 3-6m height

B) Advantages of the Kokowall Noise Barrier®

The application of coconut fibres ensures unique product features. The advantages of the Kokowall noise barrier are outlined below.

Lightweight Construction

Concrete barriers or banks cannot be placed everywhere due to their weight and size. The foundation of the Kokowall noise barrier is actually very narrow, thereby ensuring relatively little loss of space. The lightweight and modular construction of the Kokowall noise barrier ensures a quick, low-cost assembly process.

Kokowall Noisebarrier in Amsterdam Z-O, H=3m

"Graffiti-unfriendly"

A significant disadvantage to the mostly smooth concrete constructions is their "graffiti-friendly" surface. Removing graffiti can cost as much as € 10,000 without the guarantee of there being a spotless wall the next morning. The Kokowall barrier however does not make for a very graffiti-friendly surface, as said surface is diffuse; also, the graffiti does not adhere well to the very absorbing coconut fibres. In case the Kokowall barrier is sprayed on then the graffiti can be hidden from view by having the barrier grown over with climbers as mentioned earlier.

Greenery

Kokowall barriers are very suitable for overgrowth by climbers (f.e., the Hedera climber). Climbers adhere well to coconut fibres as said fibres represent a natural environment for aerial roots.

The Kokowall barrier will look very natural by having it grown over; also, the construction will not affect the appearance of already present greenery.

Kokowall Noisebarrier in Weert H=3m, l=50m

Competitively Priced

Compared to traditional concrete noise barriers, the Kokowall barrier is competitively priced. This makes the barrier affordable to persons who, despite their approved noise control situation, still experience noise nuisance. A price estimate is provided by means of a quote.

Decorative Aspects

Kokowall's decorative barriers and noise barriers are one with their surroundings. The material allows the client to design creatively. We will gladly assist you in the design and assembly process.

C) Product Information

- Designs:** A Kokowall noise barrier can be supplied "made to measure" up to 6 metres in height (or higher) starting from the ground level. In addition, there are several different finishes to choose from:
- Mesh panelling: panels are treated on one side with galvanised steel mesh
- Kokowall panels are either combined - or alternated - with acrylic plates
- Powder-coated, steel construction and framework of panels
- Synthetic material:** The pipes are made of a tough synthetic material (recycled ABS) without PVC. In turn, this synthetic material can easily be recycled. The crash-resistant pipes are manufactured onsite at Kokosystems thereby maintaining a constant quality standard.
- Coconut:** Coconut fibres derive from the coconut shell. It is therefore a natural product of the coconut. The quality of coconut fibres can be compared with tropical hardwood. Think of a coconut mat at the front door or marine rope. Both require a durable fibre: coconut fibre.
- Decomposition:** Coconut fibres absorb very little water during normal outdoor usage, which means that the fibres will not decompose. The fibres dry quickly, which protects the barrier from the onset of mould or moss.
- Planting:** Kokosystems supplies metal clamps with which all sort of plants can easily be fastened to the Kokowall barrier. By means of the clamps, the barrier can "turn green" instantly. For example, 2-metre high Hedera climbers cover 50% of the barrier, and will cover the barrier completely within a short time-span.
- Greener:** Hedera climbers or vines hardly require upkeep as far as pruning is concerned. The Hedera first climbs vertically, after which it will tilt without extra support. The Passion plant is also an excellent choice for this purpose.
- Fireproof:** The coconut fibres are impregnated with Firestop, which is an ecologically sound, fireproof application. The coconut fibres therefore fall into flame spread category 1, NEN 6065 standard.
- Maintenance:** The Kokowall barriers are basically maintenance free. In time, the coconut fibres will turn lighter in colour due to sun exposure. However, the fibres will maintain their natural look and remain tough.
- Recycling:** Nothing but fully recyclable materials are applied in the design and construction of Kokowall noise barriers.
- Placement:** Specialised VCA-certified contractors execute the placement of the barriers.
- CE marking:** The Kokowall Noisebarrier is produced conform CE norm EN 14388: 2005

D) Specifications of Parts & Materials

Dimensions and pattern Kokowall Barrier:

- Standard pattern: $w_{\text{pattern,standard}}$ = panel width: 2,490, 2,960 mm or 3.960mm (hart on hart 2.500mm, 3.000mm or 4.000mm)
- Maximum pattern dimensions: $w_{\text{pattern, max.}}$ = width: 5,000 mm (with H=1,25m)
- Maximum height: h_{max} = 6 metres (4 stacked panels)
- For a Kokowall noise barrier measuring higher than 2,20 metres (starting from the ground level) the height is divided into 2 or more stacked panels.

Steel Construction:

- *Style of column:*
Taking into account the barrier's height, IPE or HE-A 120 to HE-A240 – S235 hot-dip galvanised (EN1461) with a slotted top plate, diameter 15-30 mm, DIN 17100 quality standard. Optional powder coating in any desired colour.
- *Foundation columns:*
Taking into account the barrier's height, HE-A 120 to HE-A 240, S235 hot-dip galvanised (EN1461 standard) with a slotted top plate, diameter 15-30 mm, DIN 17100 quality standard.

Panels:

- Framework made of cold-rolled U-80-50-3, profile S235, hot-dip galvanised (EN1461), quality standard DIN 17100.
Sound insulation, single number descriptor reading - NEN-EN-ISO-717-1: $R_w = 30\text{dB(a)}$ - NEN 1793-2, Category B3 (top category for sound insulation). Please see attachment TNO Sound Insulation reading.
- Standard panel: Absorption by means of $DL.. = 7\text{dB(a)}$ - NEN 1793-1, category A2. Please see attachment TNO, sound absorption reading.
- High Absorptive panel: Absorption by means of $DL.. = >11\text{dB(a)}$ - NEN 1793-1, category A2. Please see attachment TNO, sound absorption reading.
- Mass of panels: 25 –35 kg/m² depending on applied insulation plate: 25-35 kg/m²
- Dimensions panels:

Standard width panel :	$w_{\text{panel, stand}}$	= 3.960mm or 2,960 or 2.480mm
Minimum Specification of size		= 5mm (width & height)
Maximum width panel:	$w_{\text{panel, max}}$	= 4,960 mm
Allowable placement tolerance:	$T_{\text{pl.panel}}$	= 40 mm (in relation to w_{pattern})
Maximum height panel:	$h_{\text{panel, max}}$	= 2,200 mm

Joint materials:

- Top plate or bolster for each column:
4 x M16-30 x 80 hexagon bolt quality 8.8 "THVZ" hot-dip galvanised
8 x Washer M16-30 - DIN 933 "THVZ" hot-dip galvanised
4 x Bolt M16-30 - DIN 934 "THVZ" hot-dip galvanised
- Attachment panels, per item:
8 x self-tapping hexagon shoulder pin ST.6,3 x 38 mm - DIN 7405K

Synthetic material:

- Recycled fire-retardant ABS, pipes diameter ø32 mm, wrapped in coconut fibres.
- Compriband AC self-adhesive cellular rubber, 15 x 5 mm between stacked panels.

Coconut:

- Only the longest and durable mattress fibres are applied.
- The applied coconut fibres are checked continuously in order to guarantee an EC (saline) content of < 0,5mS/cm.
- Coconut fibres serve as a bonding substrate for several climbers' aerial roots.
- Treated with Magma Firestop. Fireproofed according to NEN 6065 Flame Spread Category 1.

D) Installation Data Kokowall Noise Barrier (applicable to 3-metre high barrier)

In the summary below, several activities pertaining to the installation of a 3-metre high Kokowall noise barrier - on land that is ready for building - are listed.

1. Columns HE-A 160 with a top plate and slots are drilled into the ground down to a depth of 4.000 mm.
2. On top of the foundation columns, superstructure columns are equipped with a top plate using an M16 bolt. The top plate's slits and the bolster's slits are at a right angle, allowing the columns to be placed horizontally in both directions.

3. By means of 0,5 mm thick jaw chucks, which are inserted between the top plate and bolster of the columns, the flange posts are placed vertically.
4. After the steel construction has been installed, a prefab, 200 mm high concrete component is inserted between the HEA columns' flanges.
5. After the installation of the concrete border, the Kokowall sound panels (see drawing) are hoisted via the top between the flanges. Two panels measuring each 1,400 mm high, are used for a 3-metre high structure and placed on top of each other (see drawing no. 2). Between the panels the concrete border and the lower panel, comriband sealant rubber is inserted.
6. By means of St. 6.3 x 38 self-tapping hexagon bolts, the panels are attached to the inside of the front flange of the column thereby creating an airtight

- construction (see drawing).
7. Possible cracks at the underside (of the concrete border) are sealed with soil/dirt. After the panels are installed, plants can be fastened with specials clamps. The aerial roots of all sorts of climbers attach very well to a Kokowall noise barrier. Within a few years' time, the barrier will be completely grown over
